

So far, I have not attended any explicit statistics courses during my undergraduate studies. Nevertheless, I have attended math modules that included statistics-related content such as basic probabilities, binomial and/or normal distributions, null hypothesis tests and p-values. In addition, I have gained practical experience in dealing with large data sets and statistics, such as trade, employment or tax data, while working in environmental economics research. However, if my experience is not sufficient to fulfill the prerequisites, I will make up the deficiencies.
